# IBrokers Reference Card

IBrokers 0.9-0; TWS API 9.64

# IBrokers R API Overview

The IBrokers API parallels the official Java API provided by Interactive Brokers, LLC to access data and execution services provided to IB clients. Commands can be run interactively or automated.

The official API documentation is grouped by *EClientSocket* methods, *EWrapper* methods, and *SocketClient* objects. This document combines all related objects and methods into groups by functionality.

Where appropriate, eWrapper methods for processing incoming messages from related calls are listed.

# Connection and Server

Connecting to either the TWS or IB Gateway requires setting connection parameters external to IBrokers. Once enabled, the following commands can be used for connections and details.

connect twsConnect, ibgConnect disconnect twsDisconnect, close check connection is.twsConnection, isConnected set logging level setServerLogLevel check server version request current time request connection time twsConnectionTime

#### Contracts

All requests require validly constructed twsContract objects. The basic function to create a valid object is twsContract, though IBrokers implements wrapper functions to simplify commonly requested types such as equity, cash, and futures. Depending on the context the constructors may need more or less detail.

create any contract twsContract create equity contract twsEquity, twsSTK create equity option contract twsOption, twsOPT create future contract twsFuture, twsFUT create future option contract twsFutureOpt, twsFOP create currency contract twsCurrency, twsCASH create combo twsBAG, twsComboLeg create contract for difference twsCFD

#### Contract Details

Given a full or partial twsContract, returns a list of twsContractDetails objects; named lists containing contract details including a contract element of class twsContract. Many IBrokers calls will accept Contract arguments of twsContract or twsContractDetails.

 $\begin{array}{ll} {\tt request~contract(s)~description} & {\tt reqContractDetails} \\ {\tt extract} \ \textit{twsContract} \ {\tt from~details} & {\tt as.twsContract} \end{array}$ 

eWrapper methods:

 $contractDetails,\ bondContractDetails,\ contractDetailsEnd$ 

#### Market Data

Market Data provides for nearly real-time data from Interactive Brokers. Data is actually aggregated into one-third second 'snapshot' data from the exchange, and subsequently passed along to the client.

request market data and process reqMktData
request market data (only) .reqMktData
cancel market data cancelMktData

# eWrapper methods:

 $tickPrice,\ tickSize,\ tickOptionComputation,\ tickGeneric\\tickString,\ tickEFP,\ tickSnapshotEnd$ 

# Market Depth

Depth of book varies according to contract, and may not be available for all security types.

request market depth data reqMktDepth cancel market depth data cancelMktDepth

eWrapper methods:

updateMktDepth, updateMktDepthL2

#### Real Time Bars

Real-time bars are limited to 5-second bars by the official API. All other barSize values will fail. Realtime bars may not be available for all security types.

request real-time bars reqRealTimeBars cancel real-time bars cancelRealTimeBars

eWrapper methods:

real time Bars

### Historical Data

Depending on the contract, only specific combinations of barSize and duration arguments are valid, and some security types have no historical data. reqHistory is an IBrokers only call, allowing for one year of 1 minute bars, respecting IB timeouts (10 seconds) and maximum bars per request (2000).

request historical data reqHistoricalData request maximum history reqHistory cancel historical request cancelHistoricalData

Valid barSize values include: 1 secs, 15 secs, 1 min, 2 mins, 3 mins, 5 mins, 15 mins, 30 mins, 1 hour, 1 day, 1 week, 1 month, 3 months, 1 year.

Valid duration form is 'n S', where n is the number of periods of S. The second argument may be S (seconds), D (days), W (weeks), M (months), Y (year). Year requests are limited to 1 year.

#### Fundamental Data

Reuters fundamental data

request fundamental data reqFundamentalData cancel fundamental data cancelFundamentalData

eWrapper methods:

fundamentalData

#### News Bulletins

Subscribe to news bulletins from Interactive Brokers.

subscribe reqNewsBulletins unsubscribe cancelNewsBulletins

eWrapper methods:

newsBulletins

## Pricing

Calculate option values, price and implied volatility, via the TWS engine.

calculate option price calculateOptionPrice calculate option volatility calculateImpliedVolatility

eWrapper methods:

tickOptionCalculation

#### Orders

Orders via the IB API, and the IBrokers API, require three primary components: A twsContract object, a twsOrder object, and a placeOrder call. Additionally, a valid orderId is required to the twsOrder object. This is found by calling regIds on the twsConnection object. regIds operates directly on the connection object by retrieving and then incrementing the next valid order id in the connection object.

next valid order id reqIds create order object tws0rder place order placeOrder cancel order cancelOrder exercise options exerciseOptions open orders reqOpenOrders all open orders regAllOpenOrders, regAutoOpenOrders eWrapper methods: orderStatus, openOrder, nextValidId, execDetails

```
> placeOrder(twsconn=tws,
             Contract=twsSTK("AAPL"),
             Order=twsOrder(regIds(tws),
                             "BUY".
                             10.
                             "MKT"))
```

#### Account

Account data is requested on a subscription basis. The user subscribes to a continuously updated feed from the TWS by passing the connection object and the subscribe argument set to TRUE; unsubscribe with FALSE. The .reqAccountUpdates function will return immediately and will begin or end a subscription; account messages must be handled by the user. reqAccountUpdates (without the prepended 'dot') will subscribe, collect data, and unsubscribe - returning an AccountUpdate object which may be processed with twsPortfolioValue.

get account data reqAccountUpdates subscribe account updates (only) .reqAccountUpdates cancel account updates cancelAccountUpdates

view portfolio twsPortfolioValue

eWrapper methods:

update Account Value, update Portfolio, update Account Time, new eWrapperaccountDownloadEnd

#### Executions

Returns execution details in a twsExecution object. This **DISCLAIMER** method is currently only implemented as a request, with no built-in mechanism to manage response data apart from it being discarded.

request execution data reqExecutions filter argument reqExecutionFilter

eWrapper methods:

execDetails, execDetailsEnd

#### Financial Advisors

Funtions for FA-enabled accounts

request list of accounts request FA configuration (XML) change FA configuration

eWrapper methods: managedAccts, receiveFA reqManagedAccts requestFA replaceFA

#### Scanner

Interactive Brokers scanner data ...

scanner params (XML) regScannerParameters scanner subscription object twsScannerSubscription return scanner results regScannerSubscription

subscribe to scanner .regScannerSubscription cancelScannerSubscription unsubscribe to scanner

eWrapper methods:

scannerParameters, scannerData

# eWrapper

eWrappers contain the callback methods for all incoming message types. These are closures in R that contain functions and data. These functions are called based on incoming message types from the TWS.

eWrapper market data to vector(s) eWrapper.data market data to csy eWrapper.MktData.CSV
